KARNATAKA-FIRST | INDIA-READY

KARNATAKA POLICE MODERNISATION PROJECT

Complete Technical and Operational Reference Manual

Chapter 4

Existing Police Infrastructure and Digital Ecosystem

A discovery guide to existing police, emergency-response, cybercrime and criminal-justice platforms.

TEAM REFERENCE EDITION

Technical • Operational • Governance • Security

Prepared for: Project Team
Version 0.1 | November 2026

Independent project concept and team working document.
Not an official Karnataka Police publication and not endorsed by the Government of Karnataka.

Document Control

Document field	Description
Document title	Karnataka Police Modernisation Project - Complete Technical and Operational Reference Manual
Current chapter	Chapter 4 - Existing Police Infrastructure and Digital Ecosystem
Version / status	0.1 - Initial working draft; subject to research, consultation and approval
Prepared for	Internal project team and authorised reviewers
Geographical starting point	Karnataka, India; national ecosystem context where relevant
Purpose	Give the team a shared domain and systems context before requirements and implementation are approved

Important Status and Use Notice

This manual is a project-planning and engineering reference. It is not a government order, departmental instruction, procurement document, statutory interpretation, operational procedure or authorisation to access police systems or personal data. System descriptions are based on cited public information and may not represent current deployment details in Karnataka. Any workflow, interface, integration, data exchange or access model requires validation and written approval from the relevant system owner and competent authorities.

How to Read This Chapter

The chapter explains the operating environment and translates it into design considerations for the proposed programme. Treat recommendations as discovery and architecture inputs. Do not treat a public portal, published policy or technical possibility as permission to connect, copy or process data.

Table of Contents

Section	Topic
4.1	Purpose and System-Discovery Method
4.2	Existing Karnataka Police Systems
4.3	CCTNS
4.4	ICJS
4.5	Emergency Response Support System - 112
4.6	National Cyber Crime Reporting Portal
4.7	e-Courts and e-Prosecution
4.8	e-Forensics and e-Prisons
4.9	Citizen Services and Digital Police
4.10	Communication Networks and Data Management
4.11	Integration Opportunities
4.12	Existing Infrastructure Gaps
4.13	System Inventory and Assessment Template
4.14	Integration Decision Gate
	Chapter Summary
	References and Source Notes

Chapter 4 | Existing Police Infrastructure and Digital Ecosystem

PART 1 - INTRODUCTION TO THE PROJECT

4.1 Purpose and System-Discovery Method

This chapter introduces the principal public-facing and justice-sector digital systems relevant to a Karnataka police modernisation programme. It is a discovery map, not a deployment inventory. A system's public presence does not prove that a particular office uses it, that its records are complete, or that an API or integration is available.

4.2 Existing Karnataka Police Systems

The first discovery task is to build an approved inventory of state and local applications, infrastructure and operating procedures. Include system owner, business purpose, users, jurisdictions, authoritative data, hosting and network boundary, vendor or support arrangement, availability, interfaces, security classification, retention, and known paper or offline steps. Confirm the inventory through authorised departmental workshops and current records; do not infer it from public portals alone.

4.3 CCTNS

The Crime and Criminal Tracking Network and Systems (CCTNS) is an MHA programme implemented with States and Union Territories. NCRB describes CCTNS as supporting police station crime and criminal information workflows and citizen services. CCTNS is a foundational dependency to assess before proposing new complaint, case, investigation, station or crime-record functions. The exact Karnataka deployment, modules, data ownership, approved interfaces and migration position must be confirmed with authorised owners.

4.4 ICJS

The Inter-Operable Criminal Justice System (ICJS) is described by MHA as integrating information across the police (CCTNS), courts (e-Courts), prisons (e-Prisons), forensic laboratories (e-Forensics) and prosecution (e-Prosecution). Its purpose is to facilitate a more connected justice process. The project should map where a workflow enters and exits ICJS, what data is exchanged, and what the approved state channel is. Do not create a parallel cross-pillar repository as a shortcut.

4.5 Emergency Response Support System - 112

ERSS provides an emergency response framework associated with the 112 number. The project should discover the state control-room setup, call-taking and dispatch workflow, location handling, escalation paths and systems of record. Any connection to dispatch or incident data is safety-critical and requires owner approval, operational testing, resilience planning and clear fallback procedures. The proposed platform should not replace the emergency number or dispatch service without formal authorization.

4.6 National Cyber Crime Reporting Portal

The National Cyber Crime Reporting Portal is a public channel for reporting cybercrime and related concerns. It supports public submission and tracking functions as described by the portal. The operational team must establish how reports are routed, reviewed and linked to state processes. Do not label every portal submission as an FIR or create duplicate intake without an approved handoff model. Emergency financial fraud response may require separate time-sensitive action by the citizen and authorised agencies.

4.7 e-Courts and e-Prosecution

e-Courts and e-Prosecution support distinct court and prosecution workflows. MHA identifies them as components connected through ICJS. Police workflows can depend on court dates, filings, notices and prosecution coordination, but these records remain controlled by their owning institutions. Any exchange must preserve source attribution and legal status, and avoid presenting a copied status as the authoritative court record.

4.8 e-Forensics and e-Prisons

e-Forensics supports forensic laboratory workflows, while e-Prisons supports prison and prisoner management. Their relationship to police work may include evidence submissions, results, custody or identity-related queries through authorised channels. The project should document chain of custody, evidence integrity, permitted query purpose, response provenance and retention. Access is controlled and should be purpose-bound.

4.9 Citizen Services and Digital Police

NCRB identifies Digital Police and state/UT citizen portals as part of the public-facing landscape. Relevant services can include complaint tracking, requests for verification or other state-defined services. Catalogue each service by state, audience, eligibility, required identity data, channel, processing office, expected response and relationship to formal police records. Provide accessible alternatives for people who cannot use a digital channel.

4.10 Communication Networks and Data Management

Police operations may use secure government networks, state data centres, approved cloud environments, radio and telephony, identity services, messaging and document stores. Their presence and configuration are not assumed here. Discovery should establish approved hosting boundaries, connectivity at stations and field locations, offline needs, time synchronisation, backup, disaster recovery and monitoring. Sensitive operational data must not be moved to consumer services or unapproved environments.

4.11 Integration Opportunities

Potential integration areas include identity and organisation reference data, complaint or case references, emergency referrals, status updates, authorised document exchange and aggregate reporting. For every candidate, record the business owner, system owner, lawful purpose, data elements, direction, frequency, authentication, approval, audit, error handling, reconciliation and support route. Prefer documented, versioned interfaces approved by system owners. Where none exists, use a governed manual process rather than scraping, screen automation or direct database access.

4.12 Existing Infrastructure Gaps

A gap is a verified difference between an approved operational need and current capability. Possible topics for assessment include connectivity, duplicate entry, inconsistent identifiers, incomplete data, accessibility, language support, training, user support, resilience and inter-system handoffs. These are questions to investigate, not findings about Karnataka Police. Validate each gap with evidence and affected users before adding it to requirements.

4.13 System Inventory and Assessment Template

- Identify the business owner, technical owner and authoritative record for each system.
- Document current users, unit coverage, workflows, service hours and offline fallback.
- Record hosting, network zone, identity and access model, audit and incident contacts.
- Confirm approved interfaces, data-sharing authority, limitations and change process.

- Map data classification, retention, correction, export and archival responsibilities.
- Capture known issues with evidence, affected roles and operational impact.
- Mark every statement as verified, reported, inferred or pending confirmation.

4.14 Integration Decision Gate

Before an integration enters a delivery plan, require a named business sponsor and system owner; a documented use case and lawful authority; approved data-sharing and security review; interface specification and test environment; operational owner and support agreement; performance and failure handling; audit and retention controls; and written approval to proceed. Reassess when purpose, data scope, access or system ownership changes.

Chapter Summary

Karnataka police operations sit within an existing national and state digital landscape. CCTNS and ICJS are core reference points, alongside emergency response, cybercrime reporting and justice-sector systems. The proposed programme should discover current deployments, avoid duplicating authoritative records and pursue any exchange through authorised, documented, security-reviewed interfaces.
